1 Notes for the planning engineer

1.1 Overview

The **e-LINKS** option allows the integration of Condair CP3 Pro humidifiers into a **BACnet/IP** or a **LonWorks** network. The e-LINKS option features a serial-interface Gateway which converts the information from the host Modbus protocol to a specified secondary protocol.

The following protocol options are available and must be specified when ordering (ordering form see page 23):

Part Number	Protocols	Part Description
2534853	BACnet/IP	BMS CP3 Pro Master set for BACnet /IP
2534854	LonWorks	BMS CP3 Pro Master set for LonWorks
2534855		BMS CP3 Pro Slave set for successive units

The following read out and settings functions are available:

Functions	CP3 Pro
Read out of unit status (operating mode, etc.)	X
Read out of service messages	X
Read out of analog (%) and sensor (%rh) demand	X
Read out of unit type	X
Read out actual system request	X
Demand signal (%) / sensor signal (%rh)	X
Setting the power limitation	X
Setting the humidity setpoint (%rh / internal controller)	X
Setting the proportional range	X
Setting the integral time	X

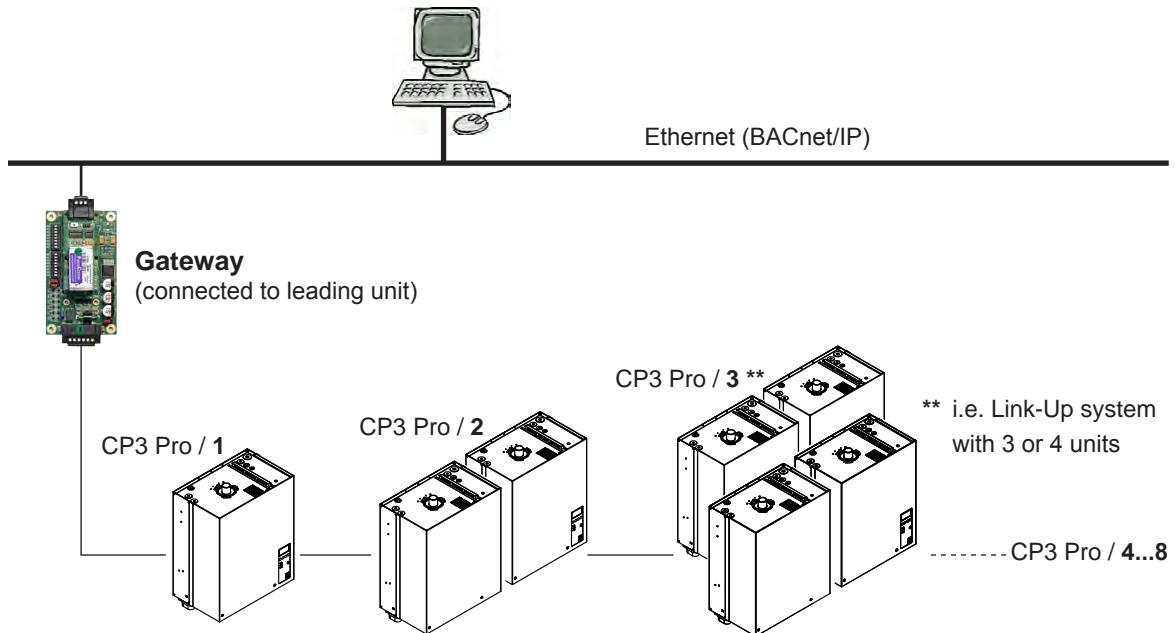

1.2 Network diagrams

It is possible to link up a maximum of 8 units via a single **ProtoCessor Gateway** to a building management system. The ProtoCessor Gateway is connected to the lead unit. All other units (up to a maximum of 8) are daisy-chained via the NetworkLink terminals.

Since each unit can be separately addressed, it is possible to monitor and control each unit individually. Different network configurations may be achieved and are mostly dependant on the type of network present at the site.

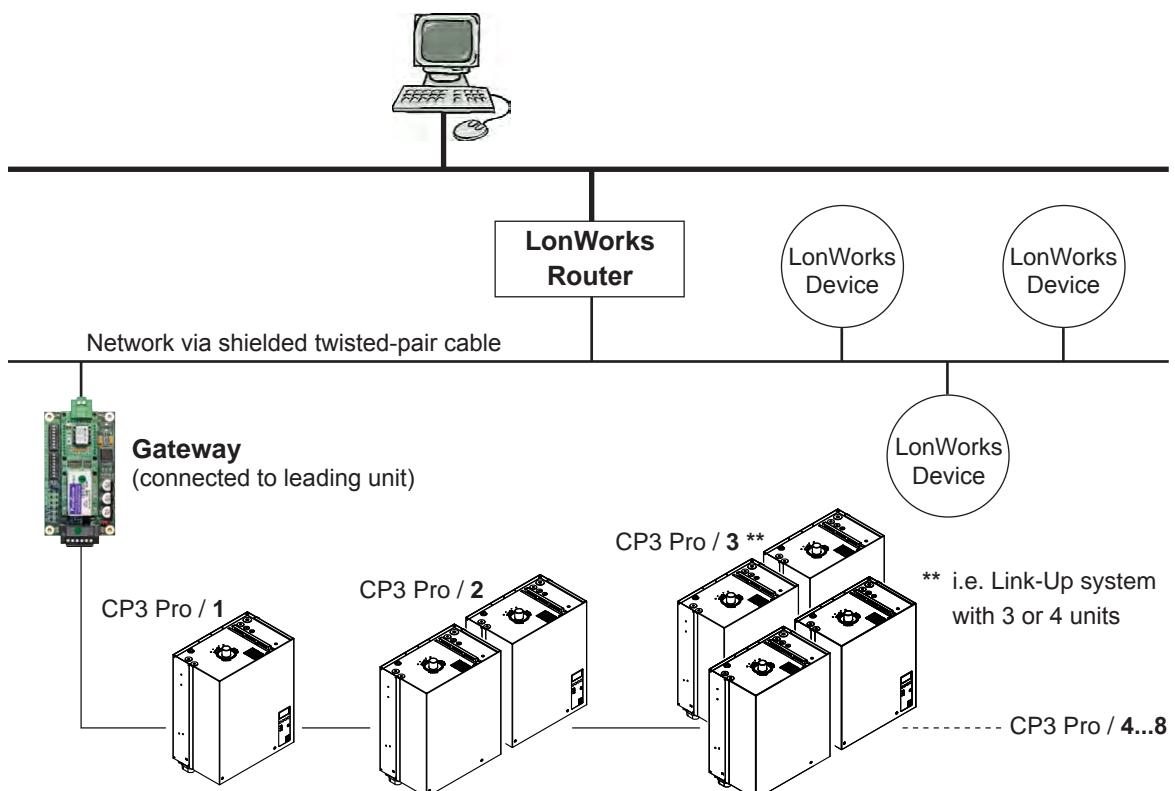

1.2.1 BACnet/IP network

The diagram below shows the connection of a series of CP3 Pro units to an Ethernet network. This is only possible for BACnet and is essentially referred to as a BACnet/IP configuration. Please see chapter 2.1 for additional details.

1.2.2 LonWorks network

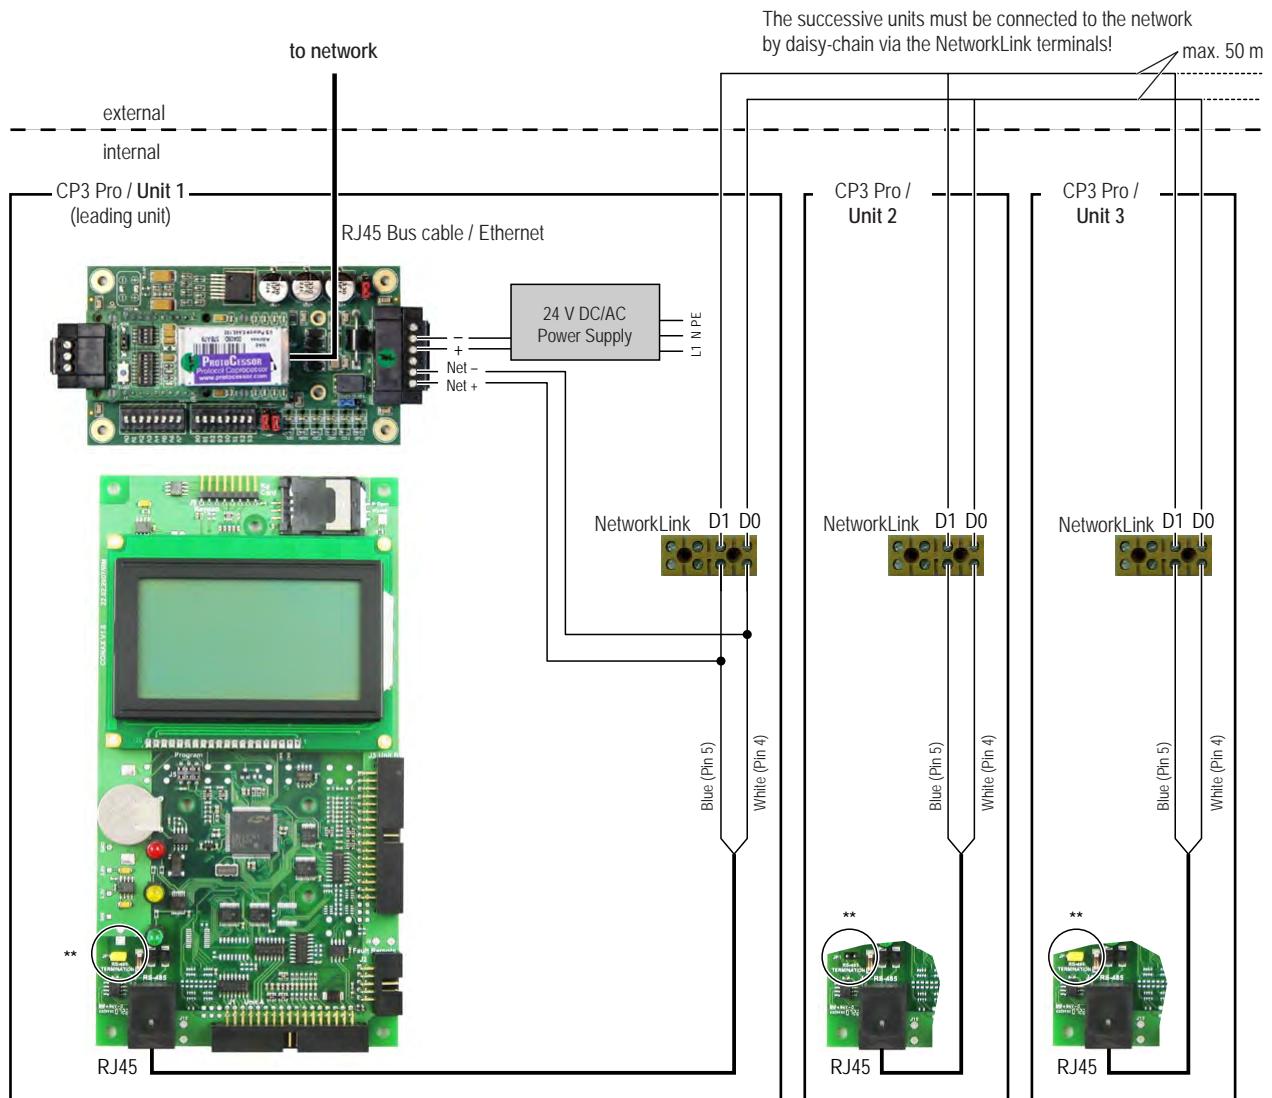

This diagram below shows the connection of a series of CP3 Pro units to a LonWorks network via a shielded, twisted-pair cable. Please see chapter 2.2 for additional details.

2 Wiring

The internal wiring and the installation of the Gateway option in the leading unit as well as the internal wiring of the successive units are made at the factory. On site only the gateway must be connected to the network (BACnet/IP or LonWorks) and the successive units must be daisy-chained via the NetworkLink terminals using two-wire cables (see corresponding wiring diagrams).

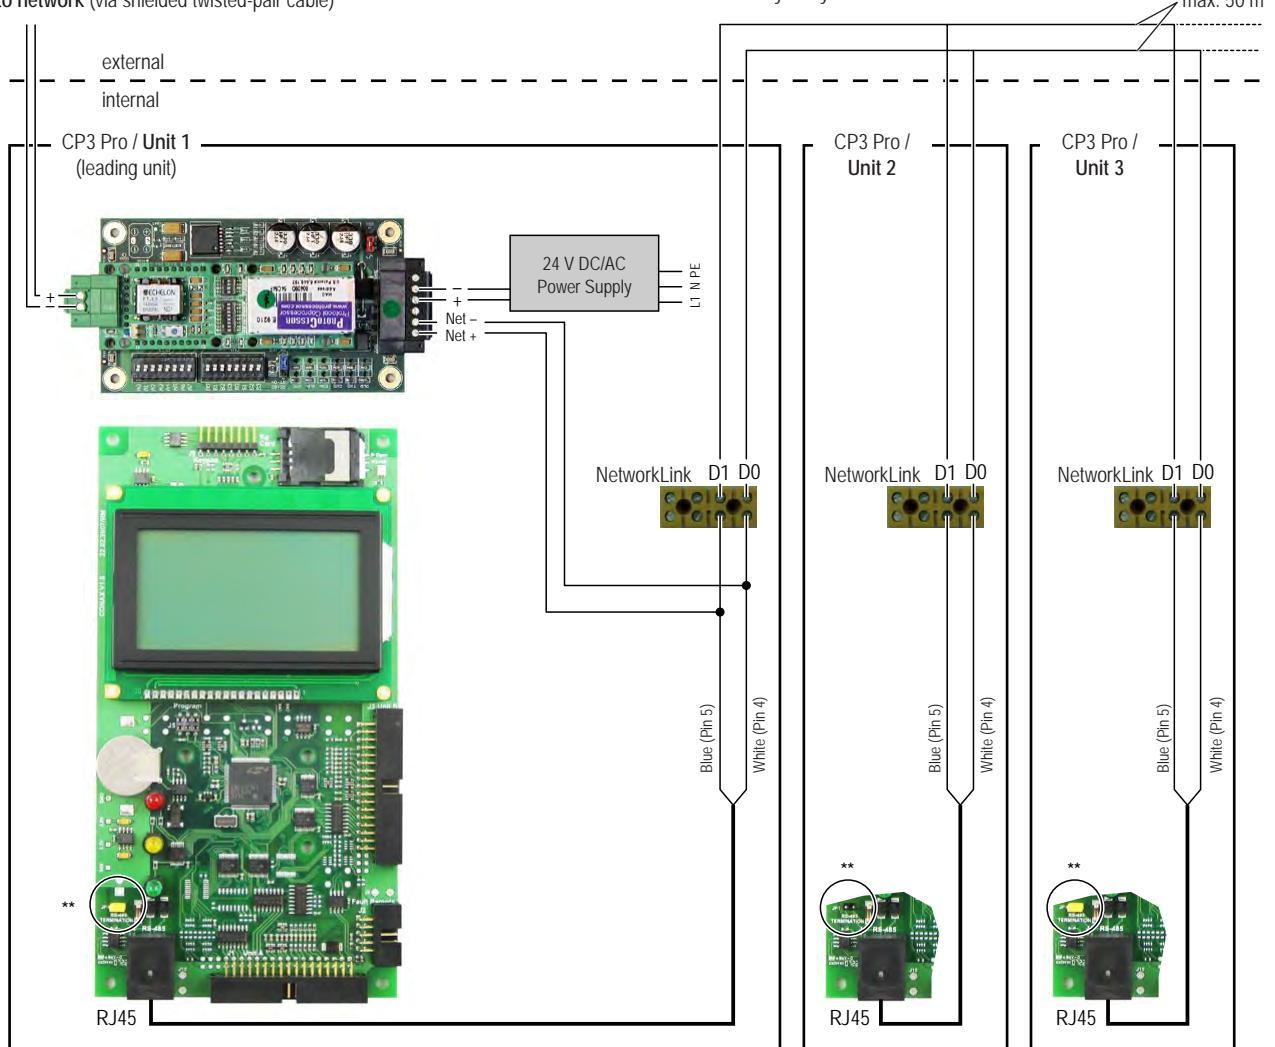

2.1 Wiring diagram for BACnet/IP

** Termination of the bus system: to ensure the correct function the bus system must be terminated on both ends. For that purpose a jumper must be set on the connector "JP1-RS 485 Termination" on the control board of the first and the last CP3 unit in the bus system. On all intermediate CP3 units the corresponding jumper must be removed (see above diagram).

2.2 Wiring diagram for LonWorks

to network (via shielded twisted-pair cable)

- ** Termination of the bus system: to ensure the correct function the bus system must be terminated on both ends. For that purpose a jumper must be set on the connector "JP1-RS 485 Termination" on the control board of the first and the last CP3 unit in the bus system. On all intermediate CP3 units the corresponding jumper must be removed (see above diagram).

3 Configuration

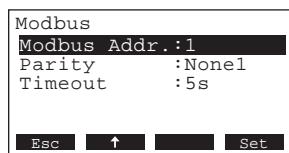

3.1 Configuring the Condair CP3 Pro control unit

The settings described below must be configured on each Condair CP3 unit (see Condair CP3 "Technical documentation" regarding the operation of the control software):

1. Modbus settings

Select the Modbus menu, Path:

Main menu > User > Password entry: 8808 > Modbus

Set the Modbus parameters as follows:

Modbus Addr.: desired Modbus address (range: 1...247)

Important: make sure the Modbus address for each unit is unique!

Parity **None1** (no parity, 1 Stop bit)

Timeout: **5s** (5 seconds)

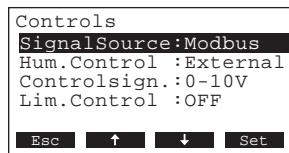

The following Modbus parameters of the Condair CP3 Pro can not be adjusted and are set to the following values:

- 9600 baud
- 1 start bit
- 8 data bits

2. Select the signal source

Select the control settings menu, Path:

Main menu > User > Password entry: 8808 > Settings > Controls

Select the parameter "SignalSource" and set it to Modbus.

3.2 Gateway configuration

The **protocol configuration is made at the factory**, prior to final testing. The baud rates are adjusted to the following values:

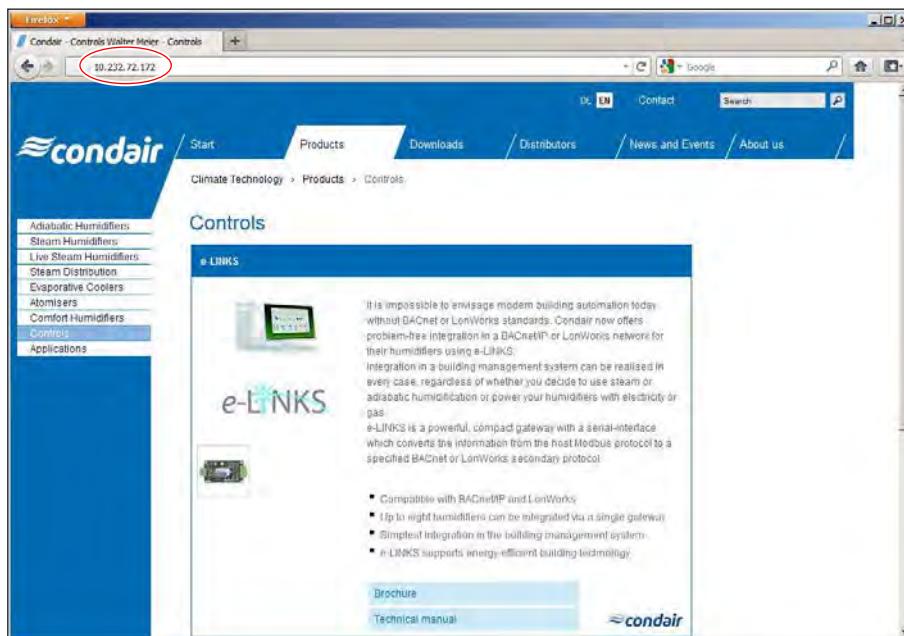

Protocol	Baud rate
BACnet/IP	10 / 100 BaseT
LonWorks	78125 bps

3.2.1 Setting the IP address and subnetmask

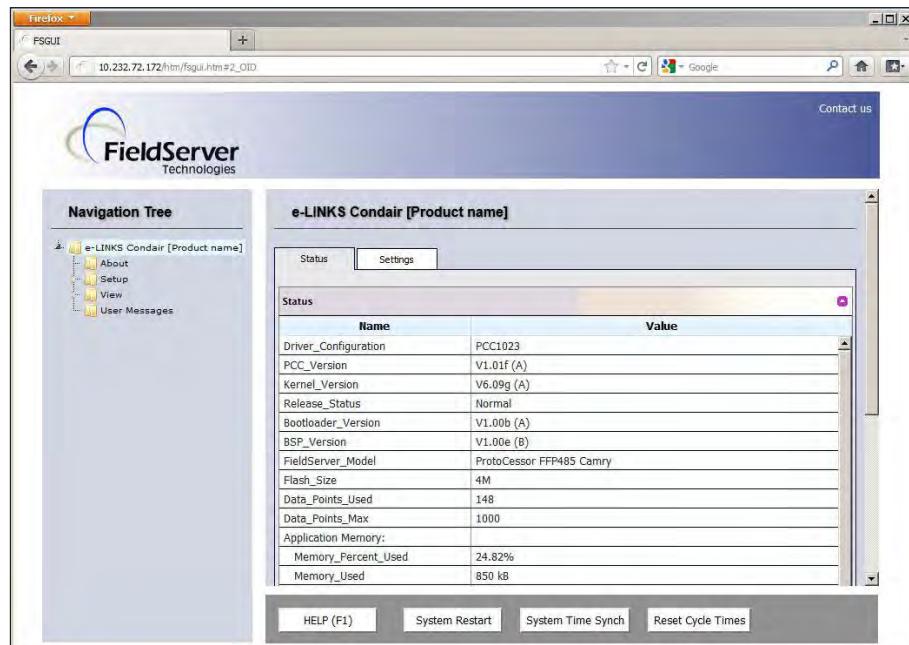

For BACnet/IP and LonWorks application, an IP address and the subnet mask must be assigned to the gateway in order to access it. The IP address and subnet mask may be assigned at the factory or can be modified at any time via the integrated FieldServer GUI (Graphic User Interface) of the ProtoCessor.

To configure the IP address and the subnet mask via the integrated FieldServer GUI of the ProtoCessor proceed as follows:

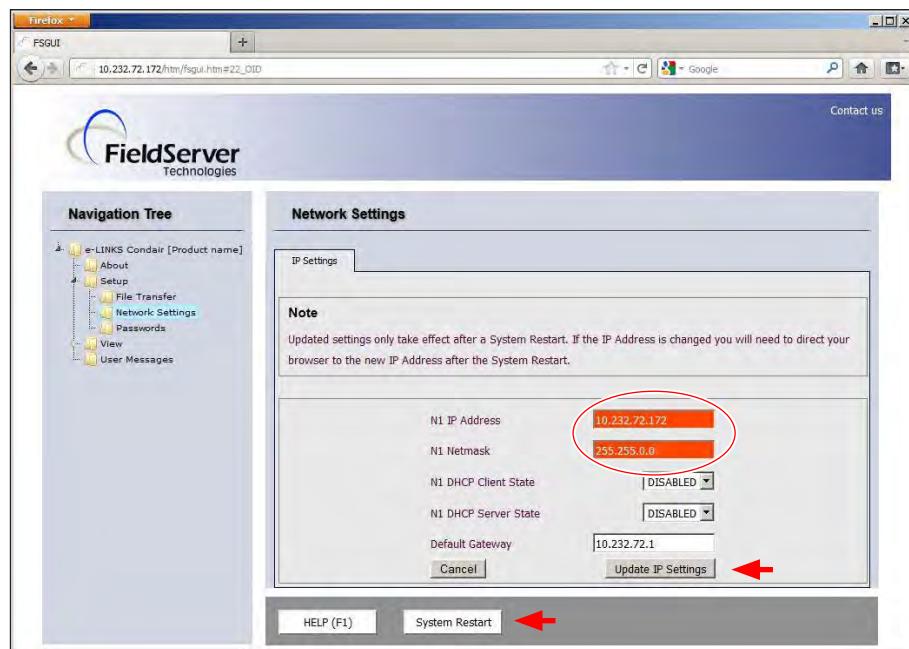

1. Connect the ProtoCessor gateway to a PC using an Ethernet cross-over cable or directly to the network using a straight cable.
2. The default IP address of the ProtoCessor Gateway is set to 10.232.72.172, Subnet Mask is 255.255.0.0.
Make sure your PC is in the same IP network as the ProtoCessor Gateway; otherwise assign a static IP address to your PC on the 10.232.72.0 network.
3. Power up the ProtoCessor Gateway.
4. Open your internet browser and enter the IP address of the gateway (by default ex factory 10.232.72.172), then confirm the entry with the Enter key.

5. The FieldServer GUI will be started.

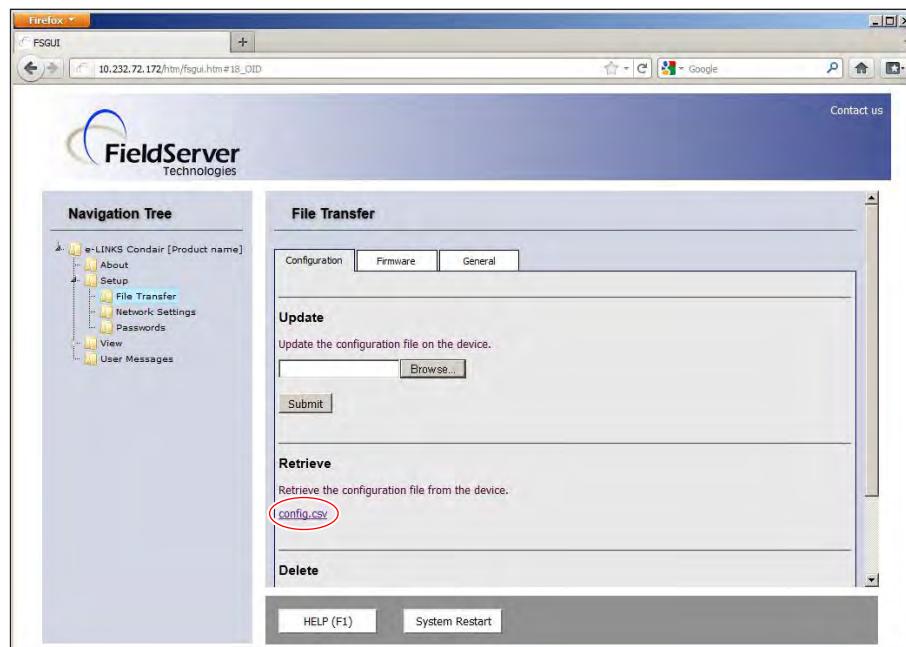

6. Select the menu point "**Setup > Network Settings**" in the "**Navigation Tree**". Enter the appropriate **IP-Address** and **subnetmask**. To activate the new settings, click first on the button **<Update IP settings>** and then on the button **<System Restart>**. After restart the gateway is configured to the new IP address and subnetmask.

7. In order to access the ProtoCessor gateway, the IP address of your laptop must be set to the same network as the ProtoCessor.

3.2.2 Modifying the BACnet Node ID

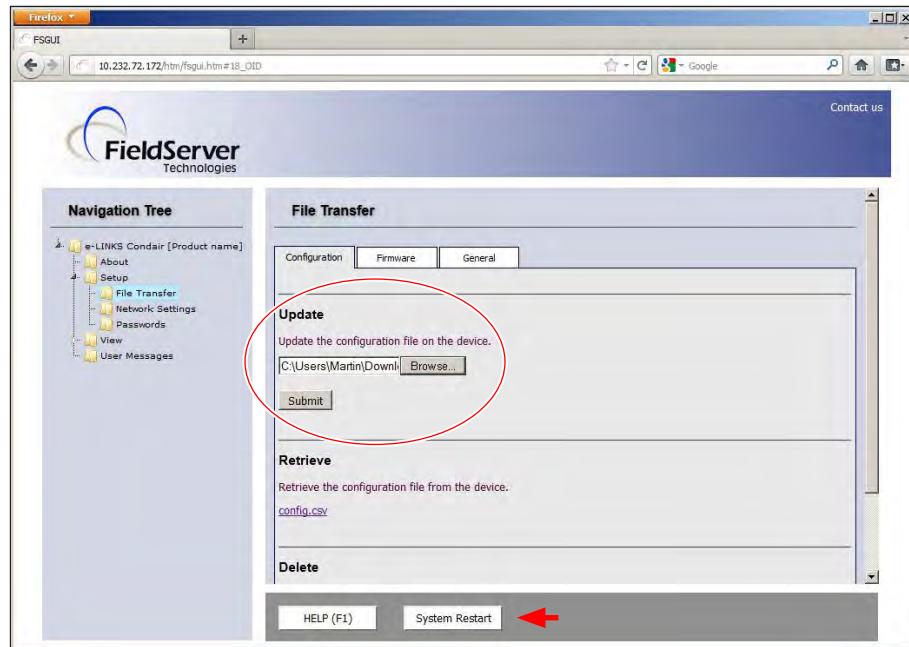

1. Enter the (new) IP address of the gateway in your internet browser and confirm the entry with the Enter key. The FieldServer GUI will be started.
2. Select the menu point “Setup > File Transfer” in the “Navigation Tree”. Then, click in the “Retrieve” section on the link “config.csv” and save the configuration file to the desired location on your laptop.

3. Open the configuration file “config.csv” with a text editor, change in the section “**Server Side Nodes**” of the window the Node ID to the appropriate value and save the configuration file.

Map_Descriptor_Name	Data_Array_Name	Data_Array_Offset	Function	Node_Name	Data_Type	Object_ID	Prop
CP3_01							
nvototSteamCap_1	,AV_01	,.00	,Server	,Virtual_BCU_CP3	,AV	,.01	,Pres

nvoIntegratTime_1	,AV_01	,.16	,Server	,Virtual_BCU_CP3	,AV	,.16	,Pres
nviIntegratTime_1	,AV_01	,.17	,Server	,Virtual_BCU_CP3	,AV	,.17	,Pres

4. Select the menu point “**Setup > File Transfer**” in the “**Navigation Tree**”. Click in the “**Update**” section on the button <**Browse...**> and select the configuration file you have modified. Then, click on the button <**Submit**> in order to upload configuration file into the ProtoCessor.

As soon as the upload is finished a corresponding message appears in the upper part of the window. Click on the button <**System Restart**> to restart the system with the new settings. After restart the Node ID is changed to the new value.

4 Communication tables

4.1 Modbus data register table

The following table shows the modbus data registers and their corresponding gateway variables.
Note: the “_x” in the gateway variable name indicates the Modbus address of the corresponding Condair CP3 Pro unit.

Name	Description	Register	Variable name on Gateway
Read total capacity	0 – 180kg/h	30009 (8)	nvoTotSteamCap_x
Read actual steam capacity	0 – 180kg/h	30010 (9)	nvoSteaActTot_x
Read actual steam capacity A-cylinder	0 – 45kg/h	30011 (10)	nvoSteaActACyl_x
Read humidity or demand	0 – 100%	30012 (11)	nvoRHorDemand_x
Read total demand	0 – 100%	30014 (13)	nvoSteaReqTot_x
Read demand A-cylinder	0 – 100%	30015 (14)	nvoSteaReqACyl_x
Read system operating seconds low	Indicates the number of seconds the humidifier has been in operating (0- 65535 sec)	30027 (26)	nvoOperatSec_x
Read system operating seconds high	Indicates the number of seconds the humidifier has been in operating (multiply by 65535 sec)	30028 (27)	
Read operating hours/6 A-cylinder	h/6 (10 min)	30100 (99)	nvoOpHour6ACyl_x
Read actual steam capacity B-cylinder	0 – 45kg/h	31011 (1010)	nvoSteaActBCyl_x
Read demand B-cylinder	0 – 100%	31015 (1014)	nvoSteaReqBCyl_x
Read operating hours/6 B-cylinder	h/6 (10 min)	31100 (1099)	nvoOpHour6BCyl_x
Read controller set point	10 – 95%RH	40005 (4)	nvoSetPointHum_x
Write controller set point			nviSetPointHum_x
Read controller proportional band	6 – 65%	40006 (5)	nvoProportBand_x
Write controller proportional band			nviProportBand_x
Read controller integral time	0 – 60 minutes	40007 (6)	nvoIntegraTime_x
Write controller integral time			nviIntegraTime_x
Read capacity limit	25 – 100%	40013 (12)	nvoCapaciLimit_x
Write capacity limit			nviCapaciLimit_x
Read actual humidity value or request	0 – 100% (by Modbus)	40054 (53)	nvoRemRHorDem_x
Write actual humidity value or request			nviRemRHorDem_x

Name	Description	Register	Variable name on Gateway
Read info code	1: CP3-Card Missing 2: CP3-Card Empty 3: CP3-Card Invalid 4: CP3-Card Incompat 5: Modul-B Missing 6: Main Missing 7: Extended Error 8: Extended Incomp. 9: Illegal HW-Settings 10: Flash R/W Fault 11: Clock R/W Fault 12: Timer Disable 20: Safety Loop Open 21: Cyl.Max&NoCurr 22: Max.Filltime 23: No Current 24: Over Current 25: Excess Current 26: Req.Off Current 27: Foam 28: Cyl. Read unit status	0 = standby 1 = humidifying	30033 (32)	nvoHumStatus_x
Read safety chain status	0 = open (not ok) 1 = closed (ok)	30301 (300)	nvoExtSChACSta_x
Read fill valve B-cylinder	0 = off 1 = on	31029 (1028)	nvoFillValBCyl_x
Read drain pump B-cylinder	0 = off 1 = on	31030 (1029)	nvoDrainBCyl_x

Registers 3xxxx: read with Modbus function 04

Registers 4xxxx: read with Modbus function 03 and write with Modbus function 06

4.2 Conversion tables gateway variables

The following tables show the ProtoCessor gateway variables and their BACnet/IP and LonWorks equivalents.

Note: the number at the end of the gateway variables (e.g. “_1”) indicate the unit number (Modbus number) of the corresponding Condair CP3 Pro. If there is only one CP3 Pro humidifier, all variable names will end in “_1”. If two units are networked together, the second unit’s variable names will end in “_2”. For three networked units,... “_3” and so on.
